The drawings are objected to under 37 CFR 1.83(a). The drawings must show every feature of the invention specified in the claims. Therefore, the detection of components in a contact manner of claim 5 must be shown or the feature(s) canceled from the claim(s). No new matter should be entered.

Corrected drawing sheets in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. Any amended replacement drawing sheet should include all of the figures appearing on the immediate prior version of the sheet, even if only one figure is being amended. The figure or figure number of an amended drawing should not be labeled as "amended." If a drawing figure is to be canceled, the appropriate figure must be removed from the replacement sheet, and where necessary, the remaining figures must be renumbered and appropriate changes made to the brief description of the several views of the drawings for consistency. Additional replacement sheets may be necessary to show the renumbering of the remaining figures. Each drawing sheet submitted after the filing date of an application must be labeled in the top margin as either "Replacement Sheet" or "New Sheet" pursuant to 37 CFR 1.121(d). If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-10 and 13 rejected under 35 U.S.C. 102(b) as being anticipated by Garcia et al. (U.S. Patent 5,842,579).

Garcia et al. show a conveying plate 8 which includes a plurality of component-holders 10, component-containers 110 that hold a plurality of components 12, the components are held by the holders while being conveyed by the plate 8, a component detecting unit 130 for detecting the presence of components and a feed unit for feeding more components to the containers based on the detection of the components.

Re claim 2, a predetermined number of components are fed to the holders when they are empty or low.

Re claim 3, shown are a plurality of lines and rows and additional components are fed based on the detection of components in the lines.

Re claim 4, non-contact sensors are used.

Re claim 5, the light beam of the sensor contacts the components.

Re claim 6, shown are an inspection unit, a discharger and a collector.

Re claim 7, the plate rotates in a clockwise direction.

Re claim 8, the components are rectangular chips.

Re claim 9, vacuum suction is used.

Re claim 10, the shown sensors can be considered cameras as is broadly claimed.

Re claim 13, photoelectric sensors are used.

Claims 11, 12, 14 and 15 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
